

DRAINAGE PLATE

AREA OF USE

- Retaining Walls
- Foundation Wall Insulations
- Green Roof Systems
- Highway and Railway Tunnels
- Parking Lots and Garages

DRAINAGE PLATE

Interlayer Protecting the Structure and Waterproofing

HDPE Drainage Plate is used to remove water between the construction and waterproofing from the system through its bubbly surface designed particularly for draining high amount of water.

Drainage plate creates an interlayer protecting the structure and waterproofing by preventing a part of the pressure coming from filling material.

Since water drainage under foundation application decreases the water pressure, drainage plate helps long lasting constructions.

Numerous production opportunities as per variable pressure values for different application areas are possible.
